#### Abstract

All four enantiomerically pure 2-hydroxy-7-azabicyclo[2.2.1]heptane-1-carboxylic acids, novel restricted analogues of 3-hydroxyproline, are described. The synthesis starts with the Diels-Alder reaction between methyl 2-benzamidoacrylate and Danishefsky's diene and uses as key steps a base-promoted internal nucleophilic displacement of the methanesulfonate group in the cyclohexane ring, followed by a resolution method that involves formation of diastereomers and further separation by crystallization. This synthetic route allowed us to obtain both enantiomers of the $N$-Boc-7-azabicyclo[2.2.1]heptan-2-ones, valuable ketones used as precursors of ( - )- and (+)-epibatidine and other more interesting analogues. © 2002 Published by Elsevier Science Ltd.

## 1. Introduction

In recent years the synthesis and incorporation into peptides of conformationally constrained amino acids has become extremely important, since it represents a great advance in the creation of peptides with valuable physical properties and biological activity. ${ }^{1-4}$ Proline has an enormous impact on the conformation of peptides owing to its ability to form trans as well as cis amide bonds, thus allowing the formation of turn structures. As a consequence, analogues of natural proline have attracted significant attention. For instance, the synthesis of hydroxyprolines ${ }^{5-12}$ has been a matter of interest in order to incorporate such units into peptides, since this leads to enhanced stability of the collagen triple helix by hydrogen bonds between the hydroxyl group and the peptide backbone. The stability of the collagen helix depends strongly on the percentage of prolines and hydroxyprolines present. Moreover, 4hydroxyproline is a common component in collagenous protein, although its isomer 3-hydroxyproline is a rare $\beta$-hydroxy- $\alpha$-amino acid that has been found as a minor constituent in some proteins and both isomers, i.e. cis and trans are elements of the antibiotic teleomycin. ${ }^{13-16}$

[^0]On the other hand, 7-azabicyclo[2.2.1]heptane-1-carboxylic acid derivatives as proline analogues constitute a source of interesting compounds that include a novel class of HIV-1 protease inhibitor ${ }^{17}$ and the boroarginine thrombin inhibitor. ${ }^{18}$ Hence, the incorporation of a hydroxyl group in a predetermined position of these systems opens the way to new families of products of potential interest. In the main, three research groups (those of Rapoport, Avenoza and Cativiela) have developed the design of restricted amino acid analogues of proline that contain the 7-azabicyclo[2.2.1]heptane skeleton. For example, Rapoport and co-workers have synthesized $N$-protected 2- and 3-oxo-7-azabicyclo [2.2.1]heptane carboxylic esters $\mathbf{1}^{19}$ and $\mathbf{2}^{20}$ (interesting building blocks to obtain strained amino acids and precursors of epibatidine) and amino acid $\mathbf{3},{ }^{20}$ starting from L -serine and L -glutamic acids and involving $\mathrm{C}-\mathrm{C}$ bond formation onto the pyrrolidine ring as a key step. On the other hand, our groups have explored a synthetic route based on internal nucleophilic displacement, by an amide group, of a leaving group in a six-membered ring. The ring was created by a DielsAlder reaction between $\alpha, \beta$-didehydro- $\alpha$-amino acid derivatives and Danishefsky's diene. In this way, compounds 2 and related derivatives ${ }^{21,22}$ (starting materials in the synthesis of cis- and trans-4-hydroxyproline analogues) have been synthesized in racemic and enantiopure forms. Moreover, compounds $3,{ }^{23} \mathbf{4},{ }^{24} 5^{25}$ and $\mathbf{6}^{26}$
have been obtained in good yields. Our present goal is to obtain the building block 1 as a starting material in the synthesis of new 'chimeras,' combinations of constrained proline and serine, or strained 3-hydroxyprolines (Fig. 1).

## 2. Results and discussion

### 2.1. Synthesis of 2-hydroxy-7-azabicyclo[2.2.1]heptane-1-carboxylic acid hydrochloride ( $\mathbf{\pm}$ )-10

The starting material for our study was the transmethoxycyclohexanone $( \pm)$-7, which was obtained by Diels-Alder reaction between methyl 2-benzamidoacrylate and Danishefsky's diene. ${ }^{27}$ We have improved the yield of this reaction to $70 \%$ by using hydroquinone as a polymerization inhibitor and a 1:1 diene/dienophile ratio. Reduction of ketone $( \pm)-7$ with L-Selectride ${ }^{\circledR}$ at $-78^{\circ} \mathrm{C}$ in THF quantitatively gave the trans alcohol. Treatment of this alcohol with methanesulfonyl chloride in triethylamine (TEA) provided the corresponding methanosulfonate derivative ( $\pm$ )-8, which was used in the next reaction without further purification. Base-promoted internal nucleophilic displacement of the methanesulfonate group using ${ }^{t} \mathrm{BuOK}$ in THF, thereby yielding the 7 -azabicyclo[2.2.1]heptane system of the constrained proline analogue, gave the desired compound $( \pm)-9$ in high yield. The racemic hydrochloride amino acid ( $\pm$ )-10 was obtained in a $95 \%$ yield by hydrolysis of compound ( $\pm$ )-9 (Scheme 1).

$( \pm)-7$

$( \pm)-8$
$( \pm)-9$
$( \pm)-10$

Scheme 1. (a) Ref. 23; (b) (i) L-Selectride ${ }^{\circledR}$, THF, $-78^{\circ} \mathrm{C}$, $100 \%$; (ii) $\mathrm{MsCl}, \mathrm{TEA}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 35^{\circ} \mathrm{C}$; (c) ${ }^{t} \mathrm{BuOK}$, THF, $-78^{\circ} \mathrm{C}, 76 \%$ two steps; (d) $12 \mathrm{~N} \mathrm{HCl}, 120^{\circ} \mathrm{C}, 95 \%$.

### 2.2. Synthesis of methyl $N$-Boc-2-hydroxy-7-azabicyclo-[2.2.1]heptane-1-carboxylates $(1 S, 2 S, 4 R)-11$ and (1R,2R,4S)-11

Esterification of $( \pm)$ - $\mathbf{1 0}$ with acetyl chloride in MeOH and subsequent protection of the amine group with (Boc) $)_{2} \mathrm{O}$ in the presence of $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ gave the protected alcohol ( $\pm$ )-11, which could be separated by resolution methods. The strategy used to resolve the racemic protected amino acid involved the reaction of ( $\pm$ )-11 with ( $R$ )-(+)-methoxytrifluorophenylacetic acid $[(R)-(+)$-MTPA $]$ in the presence of DCC and DMAP to give $\left(1 S, 2 S, 4 R, 2^{\prime} R\right)-\mathbf{1 2}$ and $\left(1 R, 2 R, 4 S, 2^{\prime} R\right)-13$ as a diastereoisomeric mixture in $95 \%$ yield. These diastereoisomers were easily separated by crystallization, using octane as the solvent, to give crystals of the pure isomer $\left(1 S, 2 S, 4 R, 2^{\prime} R\right)-\mathbf{1 2}$. The purity of this material was determined by ${ }^{19} \mathrm{~F}$ NMR ( $>95 \%$ ). The filtrate was chromatographed to give the diastereoisomer ( $1 R, 2 R, 4 S, 2^{\prime} R$ )-13 and the purity of this compound was also determined by ${ }^{19} \mathrm{~F}$ NMR ( $>95 \%$ ). Hydrolysis of the chiral ester was achieved in $\mathrm{MeONa} / \mathrm{MeOH}$ and gave enantiomerically pure isomers $(1 S, 2 S, 4 R)-\mathbf{1 1}$ and (1R,2R,4S)-11 (Scheme 2).

Scheme 2. (a) (i) $\mathrm{AcCl}, \mathrm{MeOH}, ~ 60^{\circ} \mathrm{C}$, (ii) $(\mathrm{Boc})_{2} \mathrm{O}$, $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot 10 \mathrm{H}_{2} \mathrm{O}$, THF/ $\mathrm{H}_{2} \mathrm{O}$, rt $80 \%$; (b) ( $R$ )-(+)-MTPA, DCC, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt $95 \%$; (c) separation by crystallization from octane; (d) MeONa, MeOH, rt, $87 \%$.

### 2.3. Synthesis and determination of the absolute configurations of N -Boc-7-azabicyclo[2.2.1]heptan-2ones $(1 S, 4 R)$-16 and $(1 R, 4 S)$-16

Single crystals of the diastereoisomers ( $1 S, 2 S, 4 R, 2^{\prime} R$ )$\mathbf{1 2}$ and ( $1 R, 2 R, 4 S, 2^{\prime} R$ )-13 could not be obtained and so we developed a route to identify the absolute configurations of the new enantiomers. Our proposal was to derivatize the alcohols $(1 S, 2 S, 4 R)$-11 and $(1 R, 2 R, 4 S)$ 11 to obtain known chiral compounds. In this context, and taking into account the significance of $N$-Boc-7-azabicyclo[2.2.1]heptan-2-ones $(1 S, 4 R)$ - and $(1 R, 4 S)$-16 as precursors of $(-)-$ and $(+)$-epibatidine and related analogues, we decided to undertake their synthesis. ${ }^{28-30}$

We attempted the cleavage of the methoxycarbonyl group of the azabicyclo[2.2.1]heptane system. The acid ( $1 S, 4 R$ )-15 was obtained from diol $(1 R, 2 S, 4 R)$ - $\mathbf{1 4}$ by oxidation using Jones' reagent. This diol was in turn obtained from alcohol ( $1 S, 2 S, 4 R$ )-11 by treatment with $\mathrm{NaBH}_{4} / \mathrm{CaCl}_{2}$ in THF/EtOH. The decarboxylation of ( $1 S, 4 R$ )-15 was carried out by formation of the acid chloride and subsequent coupling with $N$-hydroxy-2thiopyridone. This compound was photolyzed in the presence of tributyltin hydride to give ketone $(1 S, 4 R)$ 16 in $50 \%$ yield from $(1 S, 4 R)-15$. The specific rotation of $(1 S, 4 R)-16$ was identical to that described in the literature ${ }^{22}\left\{[\alpha]_{\mathrm{D}}^{25}\left(c\right.\right.$ 1.03, $\left.\left.\mathrm{CHCl}_{3}\right)=+75.5\right\}$. The same procedure, starting from the alcohol $(1 R, 2 R, 4 S)-11$, was followed to give the ketone $(1 R, 4 S)-16$ (Scheme 3).

These transformations constitute a formal synthesis of (-)- and (+)-epibatidine. In addition, and more importantly, taking into account that the activity of epibatidine is accompanied by high toxicity, ${ }^{31}$ $N$-Boc-7-azabicyclo[2.2.1]heptan-2-ones ( $1 S, 4 R$ )-16 and ( $1 R, 4 S$ )-16 can also be considered as potential building blocks for the preparation of other analogues of epibatidine.
2.4. Synthesis of all four 2-hydroxy-7-azabicyclo[2.2.1]-heptane-1-carboxylic acids $(1 S, 2 S, 4 R)-10,(1 R, 2 R, 4 S)$ $10,(1 S, 2 R, 4 R)-19$ and $(1 R, 2 S, 4 S)-19$

Acid hydrolysis of the methyl ester and $N$-Boc groups in the compound ( $1 S, 2 S, 4 R$ )-11 quantitatively gave the required amino acid hydrochloride $(1 S, 2 S, 4 R)-10$, in which the alcohol group is in the endo disposition. In order to obtain the alcohol in the exo disposition, we synthesized the enantiopure protected ketone ( $1 S, 4 R$ )17 by treatment with Dess-Martin reagent in dichloromethane. This compound is an excellent building block for analogues of $\alpha$-amino acids through further functionalization. Rapoport and Hart obtained the same building block, 1 , with other protective groups ( $N$-Cbz and tert-butyl ester) in only $4 \%$ yield from L-serine, whereas our route gives an improved yield of $13 \%$ for the enantiopure ( $1 S, 4 R$ )-17 (from $\mathrm{D}, \mathrm{L}-\mathrm{ser} \mathrm{m}_{\mathrm{ne}}$ ) (Scheme 4).

Reduction of the ketone $(1 S, 4 R)$ - $\mathbf{1 7}$ with sodium borohydride in the presence of $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ at rt gave a mixture of endo/exo alcohols in a 7:3 ratio in favour of the endo compound $(1 S, 2 S, 4 R)-11$. Surprisingly, the use of L-Selectride ${ }^{\circledR}$ at $-78^{\circ} \mathrm{C}$ gave only the alcohol

Scheme 3. (a) $\mathrm{NaBH}_{4}, \mathrm{CaCl}_{2}, \mathrm{THF} / \mathrm{EtOH}, 0^{\circ} \mathrm{C}$ to $\mathrm{rt}, 99 \%$; (b) Jones' reagent, acetone, $0^{\circ} \mathrm{C}$ to $\mathrm{rt}, 90 \%$; (c) (i) (COCl) ${ }_{2}$, DMF, dichloroethane, rt, (ii) $N$-hydroxy-2-thiopyridone, TEA, THF, $0^{\circ} \mathrm{C}$ to rt , (iii) $\mathrm{Bu}_{3} \mathrm{SnH}, \mathrm{h} v, \mathrm{THF}, 50 \%$ three steps.

Scheme 4. (a) $6 \mathrm{~N} \mathrm{HCl}, 60^{\circ} \mathrm{C}, 100 \%$; (b) Dess-Martin reagent, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, $89 \%$; (c) L-Selectride ${ }^{\circledR}$, THF, $-78^{\circ} \mathrm{C}, 76 \%$; (g) 6 N HCl , $85^{\circ} \mathrm{C}, 100 \%$.
$(1 S, 2 R, 4 R)-18$ with the hydroxy group in the exo disposition. Generally, reductions of similar substrates with L-Selectride ${ }^{\circledR}$ give endo isomers ${ }^{28}$ and we believe that the influence of the methyl ester group in position 1 is critical to this selectivity. Hydrolysis of the alcohol $(1 S, 2 R, 4 R)-\mathbf{1 8}$ led to the synthesis of the amino acid hydrochloride $(1 S, 2 R, 4 R)-19$, which possesses the hydroxy group in the exo disposition (Scheme 4).

An identical procedure was used to obtain the corresponding enantiomers $(1 R, 2 R, 4 S)$-10 and $(1 R, 2 S, 4 S)$ - $\mathbf{1 9}$ from alcohol $(1 R, 2 R, 4 S)-\mathbf{1 1}$. The specific rotations measured for these compounds were in agreement with the isomers previously synthesized, but with opposite signs (Scheme 4).

## 3. Conclusions

In conclusion, we have developed a versatile route to synthesize, for the first time to the best of our knowledge, all four conformationally constrained analogues of 3hydroxyproline that incorporate the 7 -azabicyclo [2.2.1]heptane skeleton: $(1 S, 2 S, 4 R)-\mathbf{1 0},(1 R, 2 R, 4 S)-\mathbf{1 0}$, $(1 S, 2 R, 4 R)-19$ and $(1 R, 2 S, 4 S)-19$. Moreover, we have improved the yield in the synthesis of building block 1, reported earlier by Rapoport, and obtained compounds $(1 S, 4 R)-17$ and $(1 R, 4 S)-17$. This synthetic route also allows both enantiomers of the $N$-Boc-7-azabicyclo-[2.2.1]heptan-2-ones $(1 S, 4 R)-\mathbf{1 6}$ and $(1 R, 4 S)$ - $\mathbf{1 6}$ to be obtained, and these are valuable building blocks for the synthesis of epibatidine analogues.

## 4. Experimental

### 4.1. General procedures

Solvents were purified according to standard procedures. Analytical TLC was performed using Polychrom SI F 254 plates. Column chromatography was performed using silica gel 60 (230-400 mesh). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker ARX-300 spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ with TMS as the internal standard and in $\mathrm{D}_{2} \mathrm{O}$ with TMS as the external standard using a coaxial microtube (chemical shifts are reported in ppm on the $\delta$ scale, coupling constants in Hz). The assignment of all separate signals in the ${ }^{1} \mathrm{H}$ NMR spectra was made on the basis of coupling constants, selective proton-proton homonuclear decoupling experiments, proton-proton COSY experiments and proton-carbon HETCOR experiments. Melting points were determined on a Büchi SMP-20 melting point apparatus and are uncorrected. Optical rotations were measured on a Perkin-Elmer 341 polarimeter in 1.0 and 0.5 dm cells of 1.0 and 3.4 mL capacity, respectively. Microanalyses were carried out on a CE Instruments EA-1110 analyser and are in good agreement with the calculated values. IR spectra were recorded on a PerkinElmer FT-IR spectrum 1000 spectrophotometer.
4.1.1. Methyl 1-benzamido- $c$-4-methanesulfonyloxy- $c$-2-methoxycyclohexane-r-1-carboxylate ( $\mathbf{\pm}$ )-8. Compound
$( \pm)-7(2.49 \mathrm{~g}, 8.16 \mathrm{mmol})$ was dissolved in dry THF (100 $\mathrm{mL})$ and L-Selectride ${ }^{\circledR}(14.7 \mathrm{~mL}$ of a 1 M solution in THF, 14.7 mmol ) was added dropwise at $-78^{\circ} \mathrm{C}$ under an inert atmosphere. After 4 h stirring at the same temperature, the reaction was quenched by the addition of saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$. The resulting mixture was allowed to warm up to rt and washed with EtOAc ( $5 \times 100$ mL ). The combined organic layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Evaporation of the solvent gave a residue that was chromatographed on silica gel, eluting with EtOAc , to give 2.51 g of the trans alcohol as a white solid $(100 \%)$. The alcohol was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(80 \mathrm{~mL})$ under an inert atmosphere and TEA ( $2.84 \mathrm{~mL}, 20.4 \mathrm{mmol}$ ) and methanesulfonyl chloride ( $0.95 \mathrm{~mL}, 12.2 \mathrm{mmol}$ ) were added to the solution at $0^{\circ} \mathrm{C}$. The solution was stirred at $35^{\circ} \mathrm{C}$ overnight. The mixture was washed with water $(2 \times 50$ mL ), saturated aqueous $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$ and brine. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. After evaporation of the solvent, the residue $(3.02 \mathrm{~g})$ was used in the next reaction without further purification. In order to characterize the mesylate, a small portion of the residue was chromatographed on a silica gel column, eluting with hexane/EtOAc (1:9), to give compound $( \pm)-8 . \mathrm{Mp}: 142^{\circ} \mathrm{C}$. Anal. calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{7} \mathrm{~S} ; \mathrm{C}, 52.97$; H, 6.01; N, 3.63; S, 8.32. 4.1.4. Methyl $N$-(tert-butoxycarbonyl)-endo-2-hydroxy-7-azabicyclo[2.2.1]heptane-1-carboxylate (土)-11. Acetyl chloride ( $0.57 \mathrm{~mL}, 8.1 \mathrm{mmol}$ ) was added dropwise to $\mathrm{MeOH}(30 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was stirred for 10 min and the amino acid hydrochloride ( $\pm$ )-10 (521 $\mathrm{mg}, 2.7 \mathrm{mmol}$ ) was added. The resulting solution was stirred at $60^{\circ} \mathrm{C}$ for 12 h . The solvent was removed, the residual oil suspended in diethyl ether ( 20 mL ) and the solvent was evaporated again. This process was repeated twice more and the corresponding pure methyl ester hydrochloride was obtained as a solid $(560 \mathrm{mg}, 100 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 1.55(\mathrm{dd}, 1 \mathrm{H}$, $\left.J_{3 \mathrm{n}-3 \mathrm{x}}=14.1 \mathrm{~Hz}, J_{3 \mathrm{n}-2 \mathrm{x}}=3.6 \mathrm{~Hz}, \mathrm{H}_{3 \mathrm{n}}\right) ; 1.90-2.20(\mathrm{~m}$, $3 \mathrm{H}) ; 2.45-2.55\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}_{3 \mathrm{x}}\right) ; 2.60-2.73(\mathrm{~m}, 1 \mathrm{H}) ; 3.84$ ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{OCO}$ ); 4.23 ('t', $1 \mathrm{H}, J_{4-3 \mathrm{x}}=J_{4-5 \mathrm{x}}=5.1 \mathrm{~Hz}$, $\left.\mathrm{H}_{4}\right) ; 4.63\left(\mathrm{ddd}, 1 \mathrm{H}, J_{2 \mathrm{x}-3 \mathrm{x}}=10.5 \mathrm{~Hz}, J_{2 \mathrm{x}-3 \mathrm{n}}=3.6 \mathrm{~Hz}\right.$, $\left.J_{2 \mathrm{x}-6 \mathrm{x}}=1.8 \mathrm{~Hz}, \mathrm{H}_{2 \mathrm{x}}\right) \cdot{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{D}_{2} \mathrm{O}\right): \delta 24.5,29.9$ $\left(\mathrm{C}_{5}, \mathrm{C}_{6}\right) ; 38.7\left(\mathrm{C}_{3}\right) ; 56.4\left(\mathrm{CH}_{3} \mathrm{OCO}\right) ; 61.7\left(\mathrm{C}_{4}\right) ; 72.8$ $\left(\mathrm{C}_{2}\right) ; 76.0\left(\mathrm{C}_{1}\right) ; 171.9(\mathrm{COO})$. The hydrochloride (380 $\mathrm{mg}, 1.8 \mathrm{mmol})$ was dissolved in water $(10 \mathrm{~mL})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot 10 \mathrm{H}_{2} \mathrm{O}(1.06 \mathrm{~g}, 3.7 \mathrm{mmol})$ was added. A solution of $(\mathrm{Boc})_{2} \mathrm{O}(524 \mathrm{mg}, 2.4 \mathrm{mmol})$ in THF (40 mL ) was added to the mixture. The mixture was vigorously stirred at rt for 15 h , saturated aqueous NaCl $(40 \mathrm{~mL})$ was added and the resulting mixture was extracted with EtOAc $(4 \times 40 \mathrm{~mL})$. The organic layer was dried, filtered and evaporated to give a residue, which was purified by column chromatography, eluting with hexane/EtOAc (1:1), to give $( \pm)$ - $\mathbf{1 1}(400 \mathrm{mg}$, $80 \%$ ) as a white solid. Mp: $95^{\circ} \mathrm{C}$. Anal. calcd for $\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{NO}_{5}$ : C, 57.55; H, 7.80; N, 5.16. Found: C, $57.47 ; \mathrm{H}, 7.70 ; \mathrm{N}, 5.22 \%$. 4.1.11. $\quad N$-(tert-Butoxycarbonyl)-7-azabicyclo[2.2.1]-heptan-2-one-1-carboxylic acid $(1 R, 4 S)-15$. As described for $(1 S, 4 R)-15$, compound $(1 R, 4 S)-15(237 \mathrm{mg}, 90 \%)$ was obtained starting from $(1 S, 2 R, 4 S) \mathbf{- 1 4}(250 \mathrm{mg}, 1.03$ $\mathrm{mmol}) .[\alpha]_{\mathrm{D}}^{25}=-2.0\left(c \quad 1.05, \mathrm{CHCl}_{3}\right)$.
4.1.12. $\quad N$-(tert-Butoxycarbonyl)-7-azabicyclo[2.2.1]-heptan-2-one $(\mathbf{1 S}, 4 R)-16$. To a suspension of acid $(1 S, 4 R)-15(196 \mathrm{mg}, 0.77 \mathrm{mmol})$ in dichloroethane (13 mL ) was added DMF ( $7 \mu \mathrm{~L}, 0.08 \mathrm{mmol}$ ) followed by oxalyl chloride $(170 \mu \mathrm{~L}, 1.92 \mathrm{mmol})$. The mixture was stirred for 3 h at rt and evaporated to dryness. The residue was dissolved, in the dark, in THF ( 10 mL ) and cooled to $0^{\circ} \mathrm{C}$. $N$-Hydroxypyridine-2-thione ( 180 mg , $1.62 \mathrm{mmol})$ and TEA $(240 \mu \mathrm{~L}, 1.69 \mathrm{mmol})$ were then added. The mixture was stirred for 2 h at rt and filtered. The residue was washed with cool THF and the solvent was evaporated, with protection from light, to give a yellow compound, which was used in the next step without purification. The yellow solid was dissolved in THF ( 30 mL ) and $\mathrm{Bu}_{3} \mathrm{SnH}(410 \mu \mathrm{~L}, 1.54 \mathrm{mmol})$ was added. The mixture was irradiated with a 200 W tungsten lamp at rt for 4 h . The solvent was removed and the residue was dissolved in $\mathrm{CH}_{3} \mathrm{CN}(30 \mathrm{~mL})$ and extracted with hexane $(4 \times 30 \mathrm{~mL})$. The $\mathrm{CH}_{3} \mathrm{CN}$ layer was evaporated and the residue was purified by column chromatography, using hexane/EtOAc (8:2), to give $(1 S, 4 R)-16$ as a colorless oil $(82 \mathrm{mg}, 50 \%) .[\alpha]_{\mathrm{D}}^{25}=+75.5$ (c 1.03, $\mathrm{CHCl}_{3}$ ). Anal. calcd for $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{NO}_{3}$ : C, 62.54; H, 8.11; N, 6.63. Found: C, 62.49; H, 8.18; N, 6.72\%.
